

CLAIMS

What is claimed is:

6. A molecular complex comprising a ceramic core particle covalently bonded to two or more molecules that are visible-light-sensitive initiators of anodic free-radical polymerization.
7. The complex in Claim 6 in which spacer molecules covalently connect the core particle to the initiator molecules.
8. The complex in Claim 6 in which the ceramic core particle is instead the surface of a bulk ceramic body.
9. Mixtures of said multi-functional photo-initiator of Claim 6 in ethylenically unsaturated organic monomer.
